In propositional logic, double negation is the theorem that states that "If a statement is true, then it is not the case that the statement is not true." This is expressed by saying that a proposition  $A$  is logically equivalent to not (not- $A$ ), or by the formula  $A \equiv \sim(\sim A)$  where the sign  $\equiv$  expresses logical equivalence and the sign  $\sim$  expresses negation.

Boolean logic, originally developed by George Boole in the mid 1800s, allows quite a few unexpected things to be mapped into bits and bytes. The great thing about Boolean logic is that, once you get the hang of things, Boolean logic (or at least the parts you need in order to understand the operations of computers) is outrageously simple.
