With the influential book Cybernetics, first published in 1948, Norbert Wiener laid the theoretical foundations for the multidisciplinary field of cybernetics, the study of controlling the flow of information in systems with feedback loops, be they biological, mechanical, cognitive, or social. At the core of Wiener's theory is the message (information), sent and responded to (feedback); the functionality of a machine, organism, or society depends on the quality of messages.

Wiener defined cybernetics as "the science of control and communications in the animal and machine." This definition relates cybernetics closely with the theory of automatic control and also with physiology, particularly the physiology of the nervous system. For instance, a "controller" might be the human brain, which might receive signals from a "monitor" (the eyes) regarding the distance between a reaching hand and an object to be picked up.
