Foci with large comet-tail artifacts were always associated with benign nodules except for two cases of cancer, both of which were found in hypoechoic nodules. Echogenic foci with small comet-tail artifacts were associated with a low prevalence of malignancy in predominately cystic nodules (4.0%) yet had a very high prevalence of malignancy when found in hypoechoic nodules (27.6%).

...

A hypoechoic mass is dense tissue that appears during an ultrasound and might be a tumor or a harmless growth. The comparative nature of diagnostic ultrasound testing is particularly useful for discovering a hypoechoic mass in soft tissue. As a result, the majority of these masses are found in breast tissue. Causes include cysts, benign fibroadenomas, or cancerous growths.
