The simplest combinations of resistors are the series and parallel connections illustrated in Figure 1. The total resistance of a combination of resistors depends on both their individual values and how they are connected.

determine how many atoms of each element are present on each side of the equation.

You can do this by looking at the subscripts or the coefficients. If there is no subscript or coefficient present, then you just have one atom of something. $\text{Fe} + \text{O}_2 \rightarrow \text{Fe}_2\text{O}_3$. On the reactant side, we have one atom of iron and two atoms of ...
