Viral infectious diseases have a great impact on the humankind. Pandemic, epidemic and endemic viral diseases produce considerably morbidity and mortality negatively affecting not only health and well-being but also the local and global economy by increasing school and work absenteeism as well as the healthcare systems' expenses. Probably the best example of this global threat is the ...

Microbial infections are recognized by the innate immune system both to elicit immediate defense and to generate long-lasting adaptive immunity. To detect and respond to vastly different groups of pathogens, the innate immune system uses several recognition systems that rely on sensing common struct ...

For some pathogens, neuron-immune interactions enhance host protection from infection, but for other pathogens, neuron-immune signalling pathways can be exploited to facilitate pathogen survival. Here, we discuss the role of nociceptor interactions with the immune system in pain and infection and how understanding these pathways could produce new approaches to treat infectious diseases and chronic pain.
