which ignites in order to raise the temperature of the gas. When heat is added to the system, it forces gas inside to expand. With a piston engine, this causes the piston to rise (see Figure 2), and with a gas turbine, the hot air is forced into the turbine chamber, turning the turbine (Figure 1).

Various scientists and engineers contributed to the development of internal combustion engines. In 1791, John Barber developed a turbine. In 1794 Thomas Mead patented a gas engine. Also in 1794 Robert Street patented an internal-combustion engine, which was also the first to use the liquid fuel and built an engine around that time. In

An internal combustion engine is a heat engine in which combustion (burning of fuel) takes place inside the cylinder of the engine. A high temperature and pressure force generates after burning of fuel. This pressure force use to move the vehicle or rotate wheels by use of some mechanism.
