Introduction To Survival Analysis Using

The book IS an introduction to Survival Analysis. It is exceptional in how well it described the intuition, theory (without going into derivations) and the application of survival analysis with Stata. The INTRODUCTION part comes in that it is not dealing with more advanced topics - for example, no discrete time survival analysis. Although there are some semi-advanced topics in continuous time survival analysis and it does deal with parametric and non-parametric models, left truncation etc.

- The survival function gives the probability that a subject will survive past time t . - As t ranges from 0 to ∞ , the survival function has the following properties * It is non-increasing * At time $t = 0$, $S(t) = 1$. In other words, the probability of surviving past time 0 is 1. * At time $t = \infty$, $S(t) = S(\infty) = 0$. As time goes to

Introduction to Survival Analysis in SAS. 1. Introduction. Survival analysis models factors that influence the time to an event. Ordinary least squares regression methods fall short because the time to event is typically not normally distributed, and the model cannot handle censoring, very common in survival data, without modification.
