Polymers are made by chemically linking up many copies of simpler groups called monomers. For example, polyvinyl chloride (PVC) is made by linking long chains of monomers (shown in the bracket). It's made of two carbon atoms, three hydrogens and one chlorine atom. Zerbor/iStockphoto.

Here you'll learn the definition and properties of polymers, another name for plastics. The simplest definition of a polymer is a useful chemical made of many repeating units. A polymer can be a three dimensional network (think of the repeating units linked together left and right, front and back, up and down)
