Hardness (antonym: softness) is a measure of the resistance to localized plastic deformation induced by either mechanical indentation or abrasion. In general, different materials differ in their hardness; for example hard metals such as titanium and beryllium are harder than soft metals such as sodium and metallic tin, or wood and common plastics. ...

The equiatomic alloys listed in Table 1 were produced by arc melting the elements Fe, Ni, Co, Cr and Mn (>99.9% pure) in a water-cooled copper hearth under Ar atmosphere. All these alloys are single-phase, fcc solid solution alloys, as shown in an earlier paper , and all are subsets of the quinary, single-phase, fcc-structured, high-entropy alloy, FeNiCoCrMn , , , , , .

In materials science and engineering, the yield point is the point on a stress-strain curve that indicates the limit of elastic behavior and the beginning of plastic behavior. Below the yield point, a material will deform elastically and will return to its original shape when the applied stress is removed. Once the yield point is passed, some fraction of the deformation will be permanent and ...

Aluminum alloys are increasingly being used in a broad spectrum of load-bearing applications such as lightweight structures, light rail, bridge decks, marine crafts, and off-shore platforms. A major concern in the design of land-based and marine aluminum structures is fire safety, at least in part due to mechanical property reduction at temperatures significantly lower than that for steel. A ...
