Annular ligaments. The annular ligament has its origins on the medial and lateral surfaces of distal PI. It is the most superficial structure in the region, lying just beneath the skin and fusing with the digital flexor tendon where it enters the hoof capsule. Once inside the hoof the annular ligament merges with the fibrous attachments of the unguis cartilages and digital cushion, and ...

A few days later the snake will shed the old skin. It starts the process by rubbing the corners of its mouth on some abrasive surface. The shedding proceeds with the head skin first and the snake then rolls the old skin back until the tail is the last to emerge. In a healthy snake all of the skin should come away at once.
