meat and eggs, the major species of poultry—chicken—has been used for the elucidation of developmental biology, virology, oncogenesis and immunology. Since the release of the first draft of the chicken genome in 2004, research in the “Poultry Genetics, Breeding and Biotechnology” areas have enormously improved.

Since the 1990s, molecular genetics has infused improvements in poultry breeding. Though, the world has consumed egg and meat for substantial time now, it was not until 1992 that the world saw an accelerated consumption of eggs and meat. According to sources from the World Poultry Trends, nearly 85 million tonnes of
