SIGNAL AND LINEAR SYSTEM ANALYSIS Problem 2.2 By noting the amplitudes and phases of the various frequency components from the plots, the result is $x(t) = 4e^{j(8\pi t + \pi/2)} + 4e^{j(8\pi t + \pi/2)} + 2e^{j(4\pi t - \pi/4)} + 2e^{j(4\pi t - \pi/4)} = 8\cos(8\pi t + \pi/2) + 4\cos(4\pi t - \pi/4) = 8\sin(8\pi t) + 4\cos(4\pi t - \pi/4)$ Problem 2.3 a. Not periodic because $f_1 = 1$ Hz and $f_2 = 2$ Hz

The text certainly has very comprehensive coverage of signal analysis for an introductory course, it certainly lacks the depth needed for an advanced course. And unfortunately the writing is so poor and the typos so numerous that the book cannot help but confuse and discourage those first learning a pretty complex field such as signal analysis.

Signal analysis will be established using Fourier series and Fourier transform. Then we will analyze continuous and discrete LTI systems using the Laplace and z-transforms, as well. Applications of these systems in communications, control, and signal processing will also be discussed.

Letting the z-Transform help with signals and systems analysis For discrete-time signals and systems, the z-transform (ZT) is the counterpart to the Laplace transform. With the ZT you can characterize signals and systems as well as solve linear constant coefficient difference equations. The two-sided ZT is defined as:

Nonlinear signal processing involves the analysis and processing of signals produced from nonlinear systems and can be in the time, frequency, or spatio-temporal domains. Nonlinear systems can produce highly complex behaviors including bifurcations, chaos, harmonics, and subharmonics which cannot be produced or analyzed using linear methods.
