Surface Chemistry Of Froth Flotation

1 Froth Flotation -

Online Library Surface Chemistry Of Froth Flotation Volume 1 Fundamentals

Fundamental Principles
Froth flotation is a highly versatile method for physically separating particles based on differences in the ability of air bubbles to selectively adhere to specific mineral surfaces in a mineral/water slurry. The particles with attached air bubbles are then carried to the surface and

Foam is an object formed by trapping pockets of gas in a liquid or solid.. A bath sponge and the head on a glass of beer are examples of foams. In most foams, the volume of gas is large, with thin films of liquid or solid separating the regions of gas. Soap foams are also known as suds.. Solid foams can be closed-cell or

recrystallization:

127-132 is a procedure for purifying compounds. The most typical situation is that a desired "compound A" is contaminated by a small amount of "impurity B". There are various methods of purification that may be attempted (see Separation process), recrystallization being one of them. There are also different recrystallization
