### Theory On Ruston Oil Engine

On 11 September 1918, Ruston, Proctor and Company merged with Richard Hornsby & Sons of Grantham to become Ruston and Hornsby Ltd (R&H). Hornsby was the world leader in heavy oil engines, having been building them since 1891, a full eight years before Rudolph Diesel's engine was produced commercially.. Ruston built oil and diesel engines in sizes from a few HP up to large industrial engines.

### Ruston (engine builder) - Wikipedia

Hooey! The truth is, the engine lives because oil has embedded itself into the pores of the engine's aluminum, iron, and bearings, so just enough lubrication remains to support the lightly loaded engine for a short period. We've personally tested this theory in flight by having our oil cooler burst and pump all 12 quarts overboard.

### Engine Theory: Oil System Design - KITPLANES

The Hornsby-Akroyd oil engine, named after its inventor Herbert Akroyd Stuart and the manufacturer Richard Hornsby & Sons, was the first successful design of an internal combustion engine using heavy oil as a fuel. It was the first to use a separate vapourising combustion chamber and is the forerunner of all hot-bulb engines, which are considered predecessors of the similar Diesel engine ...

After the change, the Ruston oil engine was built at the Ruston works in Lincoln and the Hornsby engine was built in Grantham, with a huge demand that was difficult to meet. New engine development continued at an increased pace and they began to be used to power a new mechanical shovel which was soon in great demand for new construction projects, and in shunting locomotives for the railroads.

### Hornsby Engine History

A thermostat, called the vernatherm (on Lycoming engines), is set to open at 185F. It shuttles cold oil directly through the engine and hot oil through an oil-to-air oil cooler before letting it go through the engine. Thus, oil temperature on these engines is a minimum of 185F, except from between a cold engine start and when the oil warms to 185F.

The RK270 Ruston diesel engine is a turbocharged and charged cooled, medium speed, high power / weight ratio engine with a stroke of 305mm and a bore of 270mm. This engine has a worthy record of service and reliability in marine propulsion, marine auxiliary, land based power generation, mechanical drives and rail traction applications, running on distillate fuel and marine diesel oil.
